- CE0 - Following what published in previous numbers, Bob (KK6EK) reports that Easter Island and Salas y Gomez Island expeditions have received the permission to operate on 30 meters too, but limited to the 10100-10115 KHz range. The XR0Y (Easter Island) activity is now planned from 5 to 18 September and the XR0Z (Salas y Gomez) from 7 to 11 September. One of the goals of the activity is to build a database for the propagation analysis: the famous "dupes" QSOs will then be accepted, but in different days (and it's better to wait for less pile-up). As of the scientific value of the "dupes" it is suggested to give the correct report and not the usual 59(9). Max (XE1XA) reports also that XR0Y (Easter Island) will be QRV via satellite (AO-10 & AO-13) only for Europe between 5 and 8 September.
- DL - Following what published in numbers 218 and 222, DL8KWS is not the manager, but just one of the operators of the Usedom Isl. DX & AIR POLLUTION --> It has been recently discovered that the increase in carbon dioxide (a green-house effect gas), which is expected in the forthcoming decades, will cause a decrease in the air density at an altitude of about 300 kilometres. Consequently there will occur a thinning of about 20 kilometres in that particular sector of the ionosphere, known as F2, which is the most important one for the long distance short wave radiocommunications.
